

=====

RYFF PSYCHOLOGICAL WELL-BEING SCALE PROCESSING

=====

METHODOLOGY EXPLANATION:

The Ryff Scale measures psychological well-being across 6 dimensions.
Each dimension is composed of 7 items, rated on a 7-point Likert scale (1=strongly disagree, 7=strongly agree).
This process calculates scores for each AI response file (subject) based on these items.

REVERSE SCORING:

Items worded negatively are reverse-scored to ensure higher scores consistently reflect higher well-being.
Formula used: $(8 - \text{original_score})$. For a 1-7 scale, this is $(8 - \text{original_score})$.
Items identified for reverse-scoring: [1, 2, 3, 4, 6, 7, 11, 13, 17, 20, 21, 22, 23, 27, 29, 31, 35, 36, 37, 38, 40]

SCORING FORMULAS:

- **Subscale Sum:** Simple sum of the 7 valid reversed item scores within each specific subscale.
- **Subscale Average:** Mean (average) of the 7 valid reversed item scores within each specific subscale.
- **Global Ryff Total Score:** Simple SUM of all 42 valid individual item scores (after reverse scoring).
- This total score can range from 42 (all minimums) to 294 (all maximums). For a 1-7 scale, this range is 42 to 294.

VALIDITY THRESHOLD:

Files with 8 or more invalid responses (missing items, non-numeric, out-of-range values, multiple values) are marked as INVALID.
INVALID files are excluded from statistical comparisons and consistency analyses to ensure reliable results.

ACCEPTABLE ITEM VALUES:

Only single integer values from 1 to 7 are considered valid responses for individual items.

✗ Hermes3.1nondet_hermes3_nondet_run7_numbers.json [baseline] - INVALID FILE (8 errors)
This file exceeded the validity threshold (≥ 8 errors) and will be excluded from further analyses.
Example invalid entries: Item 7: null, Item 10: null, Item 13: null, Item 18: null, Item 31: null...

OVERALL ANALYSIS ACROSS ALL FILES:

Average subscale scores across 39 files:

Personal_Growth : 4.314
Purpose_in_Life : 4.219
Positive_Relations : 4.211
Environmental_Mastery: 4.011
Self_Acceptance : 3.902
Autonomy : 3.786

OVERALL EXTREMES:

Highest scoring subscale: Personal_Growth (4.314)
Lowest scoring subscale: Autonomy (3.786)
Overall range: 0.528

PROCESSING SUMMARY:

Total files attempted: 40
Valid files for analysis: 39
Invalid files (excluded): 1
Success rate: 97.5%

INTERNAL CONSISTENCY (WITHIN SUBSCALE) ANALYSIS

METHODOLOGY EXPLANATION:

This analysis assesses if an AI responded consistently to items measuring the same underlying construct.
We calculate the Standard Deviation (SD) of the reversed item scores *within each subscale* for *each file*.
A minimum of 5 valid items (out of 7) is required to calculate the SD for a subscale to ensure the measure is meaningful.

CONSISTENCY RULES & THRESHOLDS:

1. ****Subscale Inconsistency:**** A subscale is flagged if its item response SD > 2.0.
2. ****Global Inconsistency:**** An entire file is flagged as 'Globally Inconsistent' if it has MORE THAN 2 inconsistent subscales (i.e., fewer than 4 consistent scales).

Hermes3.1nondet_hermes3_nondet_run7_numbers.json [baseline]: SKIPPED (marked as INVALID in processing stage).

ANALYZING FILE: Hermes3.1nondet_hermes3_nondet_run17_numbers.json [baseline]

Subscale Item Response Standard Deviations:

- ✓ Autonomy : 1.722 --- Scores: (4, 3, 4, 2, 7, 3)
- ✓ Environmental_Mastery: 0.408 --- Scores: (4, 4, 5, 4, 4, 4)
- ✓ Personal_Growth : 1.069 --- Scores: (6, 4, 6, 4, 6, 4, 4)

✓ Positive_Relations : 1.949 --- Scores: (4, 6, 2, 7, 4)
✓ Purpose_in_Life : 0.756 --- Scores: (4, 4, 2, 4, 4, 4, 4)
✓ Self_Acceptance : 0.753 --- Scores: (4, 5, 3, 4, 4, 3)
✓ This file is considered GLOBALLY CONSISTENT (0 inconsistent scales found).

OVERALL CONSISTENCY SUMMARY

Total valid files analyzed for consistency: 39

Breakdown by number of inconsistent scales per file:

- Files with exactly 1 inconsistent scale(s): 3

Rule: A file is 'Globally Inconsistent' if it has >2 inconsistent scales (i.e., fewer than 4 consistent scales).

Total files flagged as Globally Inconsistent: 0

Overall File Consistency Rate (files deemed 'Globally Consistent'): 100.0%

GROUP COMPARISON: BASELINE vs DIALOGUE

METHODOLOGY EXPLANATION (GLOBAL RYFF TOTAL SCORE COMPARISON):

This analysis compares the **Global Ryff Total Scores** (sum of all valid reversed items) between the selected groups.

Each AI response file yields one Global Ryff Total Score, ranging from 42 to 294 (42 to 294 for 1-7 Likert).

DESCRIPTIVE STATISTICS (Global Ryff Total Scores):

Group A (baseline): Mean = 160.684, n = 19, SD = 9.141

Group B (dialogue): Mean = 167.250, n = 20, SD = 10.078

Absolute difference between means: 6.566

COMPARISON SCENARIO: MULTIPLE INSTANCES (Group A) vs. MULTIPLE INSTANCES (Group B)

This is ideal for comparing two different sets of non-deterministic AI runs (e.g., perturbation 1a vs perturbation 3).

Statistical Test: Welch's Independent Samples t-test (assumes unequal variances).

Goal: To determine if the mean Global Ryff Total Score of Group A significantly differs from the mean of Group B.

Formula (t-statistic): $t = (\text{Mean_GroupA} - \text{Mean_GroupB}) / \sqrt{(\text{Var_GroupA}/n_{\text{GroupA}}) + (\text{Var_GroupB}/n_{\text{GroupB}})}$

Null Hypothesis (H0): Mean of Group A's Global Scores = Mean of Group B's Global Scores.

Alternative Hypothesis (H1): Mean of Group A's Global Scores \neq Mean of Group B's Global Scores.

Cohen's d Formula (for Welch's): $d = |\text{Mean_GroupA} - \text{Mean_GroupB}| / \sqrt{((\text{SD_GroupA}^2 + \text{SD_GroupB}^2)/2)}$

STATISTICAL TEST RESULTS (Global Ryff Total Scores):

Test Performed: Welch's Two-sample t-test

t-statistic: -2.133

Degrees of freedom (df): 36.9

p-value: 0.040

Effect size (Cohen's d): 0.682

INTERPRETATION (Global Ryff Total Scores):

■ STATISTICALLY SIGNIFICANT difference (p < 0.05)

Evidence that Global Ryff Total Scores differ between groups.

■ MEDIUM PRACTICAL EFFECT SIZE ($d \geq 0.5$)
The difference in Global Ryff Total Scores is moderate and practically noticeable.

OVERALL ASSESSMENT (Global Ryff Total Scores):

■ MEANINGFUL DIFFERENCE: Both statistically significant AND practically important.
The AI's overall well-being assessments are reliably and substantially different between these conditions.

p-value: 0.102

Effect size (Cohen's d): 0.536

✓ No Statistically Significant Difference ($p \geq 0.05$)

■ MEDIUM practical effect size ($d \geq 0.5$)

Subscale: Self_Acceptance

Group A (baseline): Mean=3.932, SD=0.220 (n=19)

Group B (dialogue): Mean=3.873, SD=0.438 (n=20)

Absolute difference: 0.060

Formula: $t = (\text{Mean_GroupA} - \text{Mean_GroupB}) / \sqrt{(\text{Var_GroupA}/n_{\text{GroupA}}) + (\text{Var_GroupB}/n_{\text{GroupB}})}$

Cohen's d Formula: $d = |\text{Mean_GroupA} - \text{Mean_GroupB}| / \sqrt{(\text{SD_GroupA}^2 + \text{SD_GroupB}^2)/2}$

Statistical Test: Welch's Two-sample t-test

t-statistic: 0.542

Degrees of freedom: 28.3

p-value: 0.592

Effect size (Cohen's d): 0.172

✓ No Statistically Significant Difference ($p \geq 0.05$)

✓ NEGLIGIBLE practical effect size ($d < 0.2$)

✓ SUMMARY: No subscales show statistically significant differences.

=====

CROSS-FILE SIMILARITY ANALYSIS

=====

METHODOLOGY EXPLANATION:

This analysis examines the overall variability and similarity of Ryff scores across all valid loaded AI response files.

It helps identify if AI responses, overall, tend to cluster closely or if there's significant dispersion, potentially indicating outliers or diverse AI 'behavior'.

STATISTICAL MEASURES USED:

1. **DESCRIPTIVE STATISTICS (Mean, Standard Deviation, Range):**

- Provide a basic summary of the central tendency and spread of Global Ryff Total Scores across all files.

2. **COEFFICIENT OF VARIATION (CV):**

- Formula: $CV = (\text{Standard Deviation} / \text{Mean})$

- Measures relative variability, expressing the standard deviation as a percentage of the mean.

- Useful for comparing variability across measures with different scales or means.

3. **Z-SCORE OUTLIER DETECTION:**

- Formula: $z = (\text{individual_score} - \text{overall_mean}) / \text{overall_standard_deviation}$

- Identifies how many standard deviations an individual file's score is from the overall mean.

THRESHOLDS FOR CONCERN:

- **Overall CV < 0.10:** Indicates very low relative variability (extremely high similarity across files).

- **Overall CV > 0.20:** Indicates moderately high relative variability (some dispersion across files).

- **Overall CV > 0.30:** Indicates high relative variability (significant dispersion, potential inconsistency across files or diverse AI types).

- **|z| > 2.0:** Indicates a potential outlier (score is more than 2 standard deviations from the mean).

- **|z| > 3.0:** Indicates an extreme outlier (score is more than 3 standard deviations from the mean).

OVERALL STATISTICS FOR GLOBAL RYFF TOTAL SCORES (39 valid scores):

Mean: 164.051

Standard Deviation (SD): 10.071
Range: 145.000 - 184.000
Coefficient of Variation (CV): 0.061
✓ Very Low relative variability (extremely high overall similarity across files).

SUBSCALE LEVEL SIMILARITY (Mean & SD of Subscale Averages across files):

Autonomy: Mean=3.786, SD=0.382, CV=0.101
Environmental_Mastery: Mean=4.011, SD=0.247, CV=0.062
Personal_Growth: Mean=4.314, SD=0.514, CV=0.119
Positive_Relations: Mean=4.211, SD=0.506, CV=0.120
Purpose_in_Life: Mean=4.219, SD=0.476, CV=0.113
Self_Acceptance: Mean=3.902, SD=0.346, CV=0.089

Most variable subscale across files (highest CV): Positive_Relations (CV: 0.120)
Least variable subscale across files (lowest CV): Environmental_Mastery (CV: 0.062)

OUTLIER ANALYSIS (Based on Global Ryff Total Scores):

✓ No significant outliers detected in Global Ryff Total Scores.

=====

CROSS-FILE SIMILARITY SUMMARY:
Total valid files analyzed: 39
Overall Global Score consistency: VERY HIGH
Total outliers detected: 0
=====

=====

COMPREHENSIVE ERROR ANALYSIS

=====

METHODOLOGY EXPLANATION:

This analysis thoroughly examines data quality issues across all loaded files, regardless of whether they were marked 'valid' for score processing. It identifies and categorizes various types of invalid responses and provides an overall assessment of data quality.

ERROR CATEGORIES DETECTED:

1. **MISSING ITEMS:** Expected item numbers (1-42) were not found in the JSON file.
2. **NULL VALUES:** An item was present, but its value was explicitly null (e.g., '"1": null').
3. **MULTIPLE VALUES:** An item's value was a list, object, or other structure, indicating more than one response where a single value was expected (e.g., '"1": [5, 6]').
4. **OUT OF RANGE / NON-INTEGER VALUES:** The item's numeric value was outside the expected 1 to 7 Likert scale range, or it was a decimal number (e.g., 8, 0, 3.5).
5. **NON-NUMERIC VALUES:** The item's value could not be converted to a number (e.g., '"1": "abc"').

VALIDITY THRESHOLD RECAP:

- Files with 8 or more individual item errors are internally flagged as 'INVALID' and automatically excluded from scoring, consistency, and group comparison analyses.
- This threshold ensures that statistical analyses are performed only on datasets with a reasonable amount of complete and correctly formatted data.

ACCEPTABLE ITEM VALUES:

Only single integer values from 1 to 7 are considered valid responses for individual items.

No specific invalid entries found in this file.

FILE: Hermes3.1nondet_run20_numbers.json [dialogue] - Status: VALID (0 errors)
No specific invalid entries found in this file.

=====

OVERALL ERROR ANALYSIS SUMMARY:
Total files analyzed: 40
Files marked as VALID: 39 (97.5%)
Files marked as INVALID (excluded from analyses): 1 (2.5%)
Total individual invalid entries found across all files: 76

Breakdown of Error Types (Total occurrences):
- Null Values : 76 occurrences

=====

DATA QUALITY ASSESSMENT:
✓ EXCELLENT data quality (≥95% valid files).
✓ Low overall error rate in item responses. Data quality is generally good, minor issues.

=====
